

In order to make it work on the chalkboard, first you need the correct theory.

This is not a totally original work but does bring together many findings of other people for a truly "Unified Theory of Everything".

The relationship of Time and Gravity

04/28/05

... understanding cold fusion, the big bang(s),
black holes, white holes, time travel, particle physics,
voids, and the unified theory of everything,
while violating the least laws of physics.

Before the Big Bang all that existed was traveling at or faster than the speed of light as energy, or the energyverse, or NTE (Non Thermal Energy). The moment NTE came out of light speed, gravity took over and exited at a white hole (to differentiate between a black hole) to exit in to the matterverse. Friction alone could account for the slow down. Black holes are just portals for matter to return to energyverse as NTE, the most powerful energy in the universe.

A dual-verse, which contains a matterverse (Everything we know and touch) and energyverse (aka; Black matter, "nothing", singularity, void, and etc) both existing all places, in space, matter, with equal power per cubic foot at the same time.

Gravity can't exist in same dimension in NTE but can coexist in the same dimensional space. Gravity, electricity, magnetism, light, radiation, and etc are caused by the matter in the energyverse. We don't see it, just as fish don't see water.

Currently we have clocks, atomic clocks, calendars and iPhones that keep track of "TIMING" which can be affected by gravity or other physical influences. NTE time doesn't tick at all. It does provide perfect synchronization for both universes.

This could explain black holes as having NO mass as they are simply a portal for the energy part of mass to return to the energyverse at the point of " singularity" which may have "white holes" in it where NTE returns to matterverse as matter, a precision recycling relationship. In a Black hole, matter is drawn in and accelerated to light speed or greater just before crossing the portal or singularity, centripetally leaving all gravitational particles in its debris rings outside, like a doormat, as they can't exist in NTE. This energy could add pressure to other areas instantly in the energyuniverse and transformed back to matter anywhere using "white holes, little or big bangs, or any light outside of our sphere, energy emitter, stars, and etc". Supporting that energy can't be destroyed, and two objects of matter can't exist in the same space. Energy can't make more energy than it is, but could receive more energy from the energyverse as it is equally everywhere.

Sub-atomic particles could be explained as NOT rare but NTE partials either slowing or speeding up before crossing the white, black hole singularity or normal transition leakage happening everywhere.

Time travel exists but you will not be able to go forward or backward in time. The amount of time required to get somewhere will be dropped to zero. If I am working on a project and I am called away to another planet 100 billion light years away, I could travel there, help that person for 10 minutes and return only 10 minutes of timing would have occurred at my home planet's original location.

Time travel is already in front of us we only need the controller or natural element, possibly undiscovered or a combination of elements to setup each end and connect it through the energyverse. It appears in ancient history that we had space travelers visit our planet. I believe they came here to retrieve all of this natural element so that we could not leave our planet and they could continue their travel. As you step through a portal, you would be stepping out at the other end simultaneously. If you were to reach through into the new location let's say 100 billion light years away with your hand you could pick up someone's dropped wallet on the other side and hand it back to them without all of you leaving your original location. If our planet was in jeopardy of being hit by any size object, it could be transported around us much more reliably, economically, and safer than attempting to destroy it. Your molecules would never be affected or changed (discombobulated). This process may not require any electronic equipment as it happens now in the universe naturally.

The energyverse is all around us, literally everywhere. Cars will no longer need hydrocarbon fuels they will just pull NTE from their current location. No more gas stations. Oil will only be used for lubrication. Homes will never buy electricity again, and all without having to "broadcast" power, NTE is already where we need it, everywhere, even in space. When you light a match you release a small amount of the energyverse, light a torch a little more, and a nuclear bomb even more. The energy we released with these methods is small in reference to the amount of energy available in that same cubic area.

Space ships, shipping companies, mail, rescue teams, buses, cars, trains, airplanes, gas stations, long police response time, even taking out the garbage will become obsolete. All garbage could be identified, sorted and go immediately to the correct recycling plant before it hits the bottom of the portal recycling container. Any money due back could be deposited real time. in your account.

Communications could be reduced to opening a small portal and just talking directly to the other end anywhere in real time not subject to speed of light.

Since time in the energyverse and gravity in the matterverse can't coexist as we see it, this could be the answer to a "unified theory of everything". Time and Timing both exist they are just not the same thing.

I agree with Einstein's theory of relativity $E=mc^2$ for one exception, we transition at $E=mc$. I believe Einstein was predicting the maximum amount of energy or NTE.
